

Test Plan

How our tests are organized:

Our tests will be organized using the following directory layout: A main folder named after the main function of which all test cases will be derived from. Inside of which, there will be three additional folders that will hold the .txt files for inputs, outputs and daily transactions respectively.

Layout Example: Login ---> LoginInputs
 --->Login1.txt
 --->LoginOutputs
 --->Login1.txt
 --->LoginTransactions
 --->Login1.txt

How they will be run:

We will be running our test cases with shell scripts.

How the test outputs will be stored and organized:

The output of our tests that will be used for comparison for later runs will be stored and organized using the following directory layout: the text file printouts of any directory structures and script files created will be stored in a main folder named after the main function the test case is derived from. Inside of which, there will be folders for each of the test cases that will contain the resulting files.

Layout Example: LoginResults ---> Login1Results ---> loginPrintout, loginScript

Problems with Requirements

- Don't know what the minimum characters for username are
- Don't know the minimum length of an item name
